1	The Scope of Epidemiology	3	
2	The Evolution of Concepts in Epidemiology	11	
	The Concept of Environment: Hippocrates	14	
	The Concept of Specific Agents	22	
	The Concept of the Host and Immunity	24	
3	Agent, Host, and Environment as an Ecological System	26	
	Abstracting Variables from Ecological Models	30	
	Uses of Models	32	
4	The Logic of Multiple Causes	41	
	Frames of Reference in Causal Models	41	
5	Systems and Levels of Organization	48	
	Direct and Indirect Cause	49	
	Ecological Fallacies	59	
6	Procedures for Establishing Causal Associations	64	
	Types of Association between Variables	64	

	Symmetrical Relationships	66	
	Asymmetrical Relationships	67	
	Reciprocal Relationships	68	
	Associations and Logical Inference: Mill's Canons		68
7	Simplifying the Conditions of Observation	73	
8	Screening Causal Models for Extraneous Factors		90
	Hypothetical Causal Variables	92	
	Control Variables	92	
	Uncontrolled Variables	93	
	Confounding Variables	95	
	Distorter Variables	100	
	Suppressor Variables and Refinement	104	
9	Elaborating the Association between Variables		111
	Simple Antecedent Variables	118	
	Explanatory Variables	120	
	Intervening Variables	121	
	Moderator Variables	124	
	Component Variables	130	
10	Using Notions of Probability	136	
11	Criteria of Judgment	140	
	Time Sequence	142	
	Consistency and Replication	148	
	Strength of Association	149	
	Specificity of Association	152	
	Coherent Explanation	154
